INTRODUCING:

THE LEG & ARM LIFT

Prevent injuries when lifting patients' arms and
legs in the operating theatre

THE LEG AND ARM LIFT

The preparation of a surgical site on either the arms or legs of a patient often requires lifting, holding and lowering procedures. This job is normally undertaken by theatre staff, and can be physically demanding.

This unique electrical lift uses a hand control to lift the patient's leg or arm into the correct position. The limb can also be lowered using the hand control to ensure a smooth and safe process.

- The lift operates by battery, and can easily be re-charged over-night.
- The leg lift can accommodate a patient in a supine, prone or sitting position.
- Bilateral lifting of 2 legs is possible with the standard equipped "2 leg lifting arm".
- A height extender (32cm) is included to help lifting arms when the patient is in a sitting position (ex.: Beach Chair).

SINGLE USE LIFTING STRAPS

Can be used to support ankle, calf, knee, arm, fingers & fore-foot etc. Skin friendly.

THE LIFT

Included with the lift are: standard lifting arm, bilateral lifting arm & height extender (32 cm).
